Funmilola Showumi

Frontend/Full-Stack Engineer | AI/Automation Engineer | LLM Engineer & AI Agent Development | n8n Expert

Lagos, Nigeria (Remote-Ready — Open to Remote & International Roles) | +234 903 642 3694 | showumifunmilola@gmail.com | Portfolio | GitHub | LinkedIn

PROFESSIONAL SUMMARY

Frontend/Full-Stack Engineer and AI/Automation Engineer with 3+ years of experience building production React, Next.js, and TypeScript applications, with full-stack range across Supabase, PostgreSQL, and serverless functions. Specializes in LLM and AI agent development, shipping a genuine Anthropic Claude API assistant into a live finance app with server-side key custody and grounded, honest system prompting. n8n expert with hands-on workflow automation experience — built a human-in-the-loop Gmail AI automation handling classification, drafting, and approval gating end to end. An AI generalist who integrates AI-assisted development tools (Claude Code, Cursor) into daily workflow while building AI-powered features and automations directly into products. Remote-ready with reliable infrastructure; open to international engagements without relocation.

TECHNICAL SKILLS

- **Frontend:** React.js · Next.js · TypeScript · JavaScript (ES6+) · HTML5 · CSS3 · Tailwind CSS · Bootstrap
- **State Management & Data:** Redux Toolkit, React Context, TanStack Query
- **AI Integration:** Anthropic Claude API (LLM-powered product features, prompt design, server-side key custody)
- **Automation:** n8n (workflow orchestration, AI classification chains, human-in-the-loop approval gating)
- **Backend & Cloud:** Supabase (Auth, Row Level Security, Edge Functions) · PostgreSQL · Netlify Functions · RESTful APIs
- **Testing & Quality:** React Testing Library, Vitest, Jest, code review, performance debugging
- **AI-Assisted Development:** Claude Code, Cursor — integrated into daily feature development, debugging, and code review workflow
- **Tooling & Workflow:** Git · GitHub · GitHub Actions (CI/CD) · Vite · Netlify · VS Code · Figma · AWS
- **Libraries:** Framer Motion · GSAP · Recharts · PapaParse · SheetJS · Three.js

SELECTED ENGINEERING PROJECTS

FinanceFlow — Personal Finance SaaS

Live Site | GitHub

- Built a production-ready personal finance SaaS with multi-currency (11-currency) envelope budgeting, CSV/Excel import, and a computed insights engine that verifies every claim against real transaction data.
- Shipped a genuine LLM-powered AI Assistant using the Anthropic Claude API, reasoning over a structured spending snapshot to answer free-form financial questions — with a system prompt that requires it to say “I don't have enough information” rather than guess.
- Built a Netlify Function as a server-side proxy to keep the Claude API key off the client, gating access behind Supabase session verification; used TanStack Query to manage caching and async chat state on the frontend.
- Tested pure data-shaping logic and both insight-panel UIs with Vitest and React Testing Library, mocking streaming responses so the suite runs offline at no cost.
- Achieved a 93 Accessibility and 100 Best Practices/SEO Lighthouse score, with 89 Performance under throttled mobile conditions (Slow 4G, Moto G Power emulation) — a strong result under a harder-than-average testing bar.

Style & Glitz — Luxury E-commerce Platform

Live Site | GitHub

- Built and deployed a luxury e-commerce platform for fine watches and GRA-certified moissanite jewelry, serving 500+ client visits since launch, with authentication, cart, wishlist, and secure checkout.
- Architected a two-step Paystack payment flow via Supabase Edge Functions — initializing transactions server-side, then independently verifying success rather than trusting the client redirect — chosen over Stripe, which doesn't support Nigerian merchants.
- Managed cart and wishlist state with Redux Toolkit, unit-testing reducer edge cases (quantity limits, toggle behavior) and covering components with React Testing Library against a real in-memory store.
- Implemented an admin dashboard with product CRUD and media uploads, locked to a single authorized account at both the database (Row Level Security) and frontend level.
- Extended the platform with a production AI shopping assistant — see Style & Glitz AI Chatbot below for the full architecture.

Style & Glitz AI Chatbot — LLM Agent with Dual-Model Fallback
GitHub

- Built a customer-facing LLM agent (n8n, Google Gemini primary with automatic Anthropic Claude fallback) answering product, policy, and order-status questions — grounded strictly in live data, never invented.
- Architected order and profile lookups to authenticate as the customer's own real Supabase session rather than a shared credential, so Postgres Row Level Security enforces data ownership at the database layer — replacing an earlier design that relied on an application-level filter.
- Discovered through testing that the agent's built-in fallback could swallow a total failure and report false success; added an independent response-validation layer so customers always receive a clear message rather than a silent failure — confirmed firing correctly in production, not simulated.
- Resolved a shared API quota conflict with a separate automation by provisioning an isolated Google Cloud project, eliminating cross-workflow rate-limit contention.

Abass & Live Wedding Website — Client Project
Live Site

- Delivered a premium wedding website for clients Live Mayele & Abass Lateef, processing 200+ guest RSVPs through a custom Supabase-backed RSVP system with real-time admin tracking.
- Built EmailJS-powered notifications and a static admin dashboard, then deployed the full production site to a custom domain.

Atlas — Full-Stack Platform (Next.js, Supabase, PostgreSQL)
Live Site | GitHub

- Built a full-stack platform with Next.js, React, and TypeScript, backed by Supabase/PostgreSQL, with secure authentication and reusable component architecture.
- Diagnosed and fixed a severe main-thread blocking issue in the Three.js 3D scene, cutting Total Blocking Time from 4,830ms to 30ms and raising the Lighthouse Performance score from 60 to 92, while maintaining 100 Accessibility, Best Practices, and SEO.

Gmail AI Automation — Human-in-the-Loop Email Assistant
GitHub

- Built an n8n workflow that classifies incoming emails with Google Gemini (sales enquiry, spam, or promotion), routes accordingly, and drafts replies for genuine enquiries — with every reply requiring explicit human approval before sending.
- Diagnosed and fixed real production bugs: a malformed recipient field from Gmail's nested API response, a broken expression causing bounced emails, and missing subject-line threading — documented in the project README.

PROFESSIONAL EXPERIENCE

Frontend Developer — Sunmence Web Agency, Remote *(2024 – 2026)*

- Delivered 10+ client projects across responsive web applications, collaborating within cross-functional teams of up to 7 (designers, backend engineers, QA).
- Managed application state using Redux Toolkit and React Context depending on project scope, and wrote component tests with React Testing Library to maintain code quality across client codebases.
- Built reusable UI components and integrated RESTful APIs into production systems, using Redux Toolkit and React Context for state management and improving performance, responsiveness, and accessibility.
- Wrote and maintained component tests with React Testing Library as part of code review and quality standards.
- Participated in Agile development — sprint planning, daily stand-ups, and code reviews — using Git/GitHub for version control.

Frontend Developer Intern — Sunmence Web Agency *(May 2023 – Nov 2023)*

- Assisted in developing and maintaining responsive web applications using modern frontend technologies, working alongside designers and senior developers — prior to completing formal education.

EDUCATION

B.Sc. Accounting — Ladoke Akintola University of Technology

- Completed alongside professional frontend development work; financial accounting foundation informs data integrity and reconciliation-aware engineering.
